

SAGE III Limb Scattering Measurements Initial Results

Didier Rault, NASA Langley Research Center

**Solar Occultation Satellite
Science Team Meeting**

Williamsburg, Virginia
May 6-7, 2003

Outline

- Limb mode of operation
- Data description
- Stray light issue
- Retrieval methodology (Ozone)
- Retrieval products. Comparison with correlative measurements
- Conclusion

SAGE III in limb mode operation

- 340 pixels to cover UV, NO₂, Chappuis, O₂ (A,B, γ), H₂O, Aerosol
- Long integration time = 1/16 second
- Field of View = 0.5 km (elevation) x 4 km (azimuth)
- Slow scanning rate = 4 arc minutes / sec (0.25 km / clock)
- Scan from nominal -70 km to 160 km
- Scan in the aft direction (anti Ram, look azimuth = 180°)
- Limit to 5 minute measurement duration (thermal issues)
- Phase 1: occasional limb measurements (Ozone sondes, SOLVE, SOLSE/LORE, SAGE III occultations)
- Phase 2: One limb scattering measurement per orbit (no Moon)
- Phase 3: Continuous limb measurements on sunlit side of orbit

Stray light

Stray light is mostly in band

SAGE III

**Scan
mirror**

Effective mirror slit function analysis

For every tangent height i , the measured data R_0 is related to the “actual” data R :

$$\mathbf{R}_0(i) = \int \mathbf{R}(\mathbf{x}) \cdot \mathbf{F}(\mathbf{i}-\mathbf{x}) \, d\mathbf{x}, \quad \text{where } F \text{ is the effective slit function}$$
$$= \omega_1 \cdot R(i) + \omega_2 (R(i+1)+R(i-1)) + \dots \omega_j \cdot (R(i+j-1)+R(i-j+1)) + \dots$$

Hence $[R_0] = [A] \cdot [\omega]$, where $A(i,j) = R(i+j-1)+R(i-j+1)$

and $[\omega] = [A]^{-1} \cdot [R_0]$

After stray light removal

Ozone retrieval methodology

- Differential method:

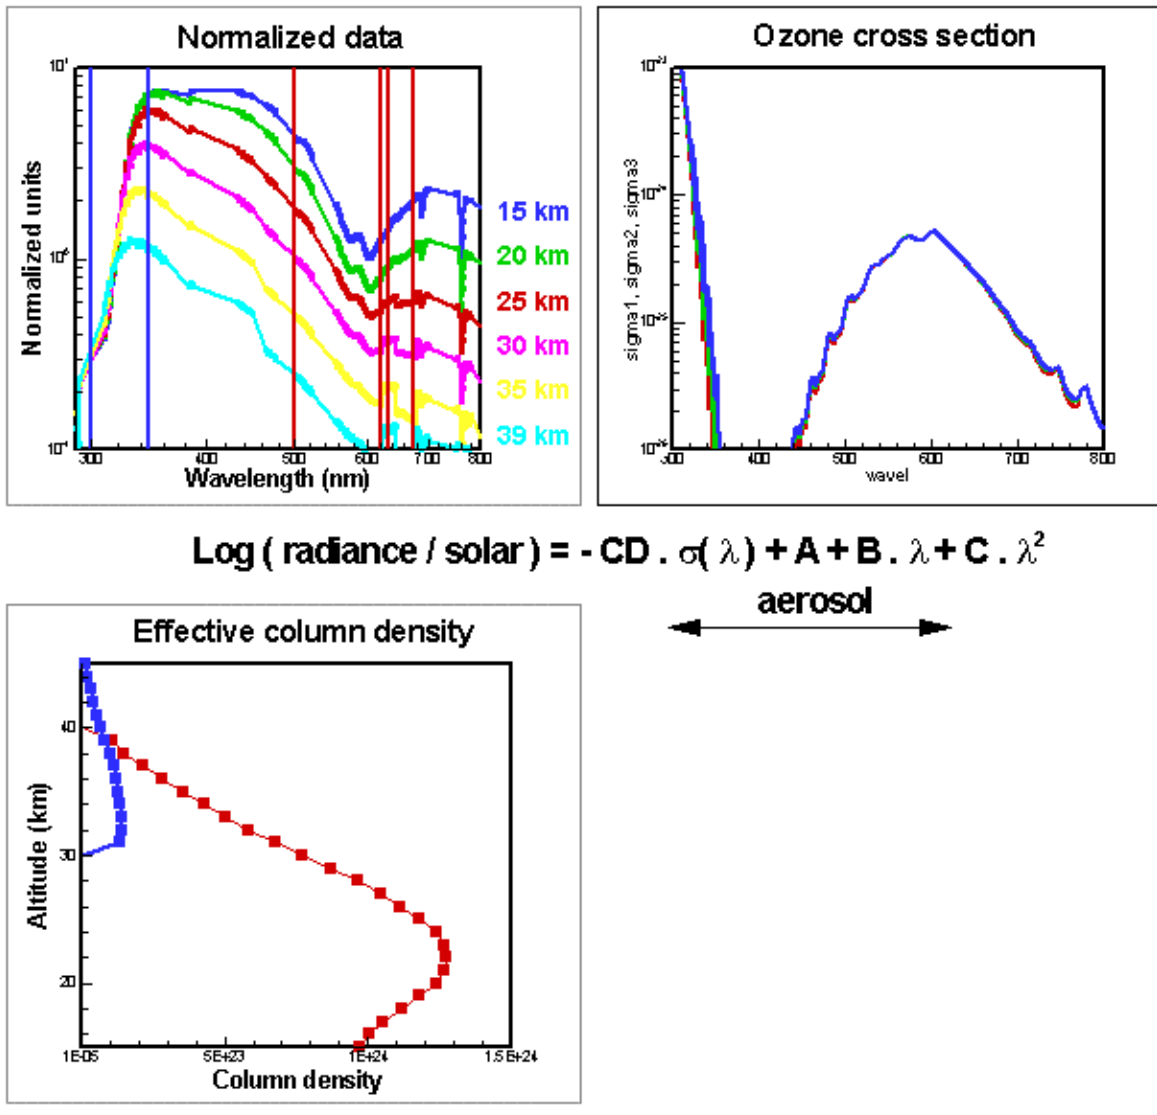

- .Flittner's Triplet/Singlet concept
- .Series of Triplets in Chappuis band and Singlets in UV
- .Forward model: U of Arizona code, modified to perform fast high spectral resolution simulations (no look up tables)
- .coupled with SAGE III instrument model

- MLR method

MLR Analysis (1)

MLR method (2)

For each tangent altitude i

$$CD_{\text{effective}}(i) = \sum_{\text{All shells } j} PL(i,j) \cdot n(j)$$

For Single Scattering,

$$R(i,\lambda) = R_0(i,\lambda) \cdot e^{-\frac{1}{2} PL(i,j) \cdot n(j) \cdot \sigma(j)}$$

So,

$$PL(i,j) = \frac{\partial \ln(R(i)/R_0(i))}{\partial n(j) / \sigma(j)}$$

And the density profile is:

$$[n] = [PL]^{-1} \cdot [CD]_j$$

Tangent Height Registration

- Three methods are being considered to perform height registration of each data point
 - **Dead reckoning**, using the spacecraft state vector and altitude parameters (pitch, roll). This method depends on high accuracy, since an error of one arc minute in angle translates into a mis-registration of 1.0 km
 - **“Knee method”** (Sioris), which considers the shape of the vertical radiance profile around 305 nm, which appears to be invariant wrt ozone density. SAGE III, however, cannot make measurements between 299 and 309 nm, and the method is applied for wavelengths of 309 to 315 nm. Future=295-299nm.
 - **“RSAS”** method(GSFC) which considers the shape of the UV radiance vertical profiles (350 nm)
 - Will investigate **O₂ band** technique (O₂ A, O₂ B, O₂ γ bands)

Conclusion

The initial results show the potentials of SAGE III in limb scattering mode. Ozone profiles have been retrieved from limb radiance measurements, and compared with Ozone sonde measurements and occultation retrievals. Further comparisons will be made with other instruments such Lidars (SOLVE mission), SOLSE/LORE, SCIAMACHY, OSIRIS.

Stray light is a major issue with SAGE III in limb scattering mode and needs to be further characterized. (Lab and Space)

Pointing / Altitude registration is another major issue (all limb instruments)

Other species will be investigated (NO_2 , Aerosol)

Signal SNR

Radiance in Low UV Channels

Data Analysis Procedure

- Read Level 0 data
- Read orbit and spacecraft attitude data
- Wavelength registration
- Correct for bias, mirror reflectivity (λ, a)
- Ephemeris \rightarrow sun position, 0th order altitude registration
- Stray light removal
- Define atmosphere T, P
- Refraction height correction
- Altitude registration (RSAS)
- Grid Data (1km)
- Read climatology
- Prepare data (height normalization, wavelength grouping, triplets,...)
- Retrieve effective surface reflectivity
- Retrieve Ozone
